Abstract (Basic): DE 19705380 C

A novel label covers information (5). It has one or more base- (1) and covering- (2) layers. The covering layer is removed by rubbing. Removal is irreversible, and reveals the covered information. The covering layer (2) contains at least one pressure-sensitive adhesive.

Also claimed is a method of covering the information, where the label may be preferably attached to a document.

USE - Used for attachment to objects, and to supply information exclusively to the customer. Examples include lottery numbers and personal identification numbers (PIN).

ADVANTAGE - The method of covering is secure and reliable. The label can be made at low cost, consuming only small quantities of material. An object may be attached to the label, for example a card, having relevance to the covered information. Because the covering layer is irreversibly removable, any prior tampering is detectable.
